

NAME

validate.php – input validation

Description

When the form on index.php is submitted, it will POST the user's name, ID, email address, and an array of classes taken. The input is then validated by validate.php. If any user input is determined to be invalid, the results are then returned to index.php and appropriate error messages are displayed. If user input is determined to be valid, the page then redirects classSelect.php, where the results will be displayed.

validation Rules

first name, last name

- cannot be empty.
- cannot contain numbers.
